

## VI.2.2B OPERATIONAL FORECAST SYSTEM DATA ENTRY DEFINITIONS

There are 2 control files that contain station data entry information that was defined using program PPINIT. The information is read from the SOURCE field on the STAN input of the DEFINE STATION command and written to the SASM or GOES control file. The information stored in these files can be printed using the programs SASMDB and GOESDB. The control files are not currently used to control the transfer of data.

There is nothing that the user must do to use the SHEF decode and post programs.
