

Synopsis

January 2023 began cooler than average with a couple of weak winter storms that brought light mountain snow. The first couple of weeks had multiple high wind events in eastern New Mexico. A winter storm in the middle of the month brought over a foot of snow to the mountains in western and northern New Mexico and more high winds to the eastern plains. About a week later, another storm brought widespread snowfall and strong east canyon winds with gusts up to 64 mph in Albuquerque. The month ended with a modified arctic airmass that brought multiple nights of very cold temperatures and freezing fog to eastern New Mexico. Snowpack continued to improve throughout the month.
