LEA COUNTY --- 1.7 ESE HOBBS IND ARPT [32.76, -103.18], 2.3 ESE HOBBS IND ARPT [32.76, -103.16], 2.4 ESE HOBBS IND ARPT [32.75, -103.16], 1.8 SE HOBBS IND ARPT [32.76, -103.17]

Heavy rain fell across Lea County and produced flash flooding near Hobbs. Millen Drive east of Highway 18 was closed due to flooding. There were reports of multiple cars floating on the sides of the road and water rescues. The cost of damage is a very rough estimate.

There was an upper ridge over the southwest part of the country with a cold front that moved into West Texas and southeast New Mexico during the late afternoon and evening hours. A lot of heat and plentiful low-level moisture were across the area which aided in instability, and there was a surface low in the vicinity of the western Permian Basin. There was an upper level disturbance that moved over the area and intense low level winds that developed that evening and night which brought in more moisture. These conditions, along with good wind shear, allowed for thunderstorms to develop across West Texas and southeast New Mexico. These storms produced large hail, damaging winds, and flash flooding.

#### TEXAS, West

PECOS COUNTY '	11.9	SSE BEL	DING	[30.62,	-102.94]
----------------	------	---------	------	---------	----------

06/01/17 15:07 CST 0 Hail (1.00 in)

06/01/17 15:12 CST 0 Source: Law Enforcement

An upper level disturbance was exiting the region with weak upper ridging developing across the area through the early afternoon hours. An upper trough was over Northern Mexico later in the day and began to move east. There was a lot of moisture and decent instability across West Texas. These conditions lead to the development of storms with large hail.

CULBERSON COUNTY --- PINE SPGS [31.88, -104.80]

06/07/17 23:52 CST 0 Thunderstorm Wind (MG 51 kt)

06/07/17 23:52 CST 0 Source: Mesonet

A thunderstorm moved across Culberson County and produced a 59 mph wind gust at the Pine Springs mesonet site.

A couple of disturbances moved over the region. There was good wind shear and instability across the area. These conditions contributed to thunderstorms that produced strong winds across West Texas.

A thunderstorm moved across Midland County and produced a 65 mph wind gust five miles northwest of the City of Midland.

A dryline was set up against across the higher terrain before moving eastward through the afternoon. Upper air disturbances moved across the region providing upper level lift. Instability was high with good moisture in place, and enough wind shear was present to sustain organized thunderstorms that produced large damaging hail and damaging winds.

During the early evening of June 14, 2017 severe thunderstorms developed along a dryline and moved across Odessa and into Midland, Texas. An upper low was over North Dakota while upper ridging was over northern Mexico. A shortwave passing over the northern part of the ridge put West Texas in westerly winds aloft and provided some upper level support for thunderstorms. Good moisture east of the dryline, strong heating at the surface with temperatures in the upper 90s to 100s, and high lapse rates lead to very strong instability. Those parameters in combination with wind shear attributed to organized thunderstorm development. These thunderstorms were not supercells, instead they were extremely strong multicellular thunderstorms with tops exceeding 60,000 feet. These severe storms produced very large hail and damaging winds as they moved across parts of the Permian Basin, impacting the highly populated cities of Midland and Odessa. Odessa received the largest hail and strongest winds.

The thunderstorms began to weaken as they moved into the City of Midland. The storm survey noted damage across a wide area of Odessa and West Odessa. There were reports of power poles snapped. There were numerous reports of baseball size or larger hail and the storm survey found evidence of hail possibly larger than softball size. Numerous homes and businesses had roof damage, windows broken and exterior siding damaged. Numerous trees were uprooted by the strong winds and thousands of cars were damaged by the large hail. This was likely caused by a microburst with estimated wind speeds of 100 mph. The damage estimate for the storms this day and on June 12th totaled to \$480 million.

an upper ridge was over the southcentral part of the country with westerly winds alort. A dryline set up across the area with very moist air across the eastern Permian Basin and Lower Trans Pecos. High Instability and wind shear were in place, which meant that conditions were favorable for thunderstorms to develop. The storms that developed became severe and produced large hail and severe wind gusts across parts of the Permian Basin and Trans Pecos.

06/18/17 18:05 CST 0 Tornado (EF0, L: 6.06 mi , W: 200 yd)
06/18/17 18:13 CST 0 Source: Law Enforcement

A thunderstorm moved across Upton County and produced a tornado six miles southeast of Rankin . The tornado was confirmed in open country south of Highway 67. There was no damage reported with this tornado so it was rated as an EF-0.

A thunderstorm moved across Reagan County and produced a brief landspout. This landspout was observed in an open field just east of State Highway 137 roughly 20 to 25 miles north of Big Lake. There was no damage reported so it was rated as an EF-0.

There was an upper level trough over the Great Lakes/Mississippi Valley region with a cold front that had passed through portions of the Permian Basin. The front created a temperature contrast between the central and northern Permian Basin. This front along with hot, unstable conditions south of the front allowed for thunderstorms to develop. These storms produced a couple of landspouts and a tornado across the southern Permian Basin and Lower Trans Pecos.

A thunderstorm moved across Reagan County and produced a wind gust of 58 mph one mile west southwest of Big Lake.

There was an upper ridge over the southwest part of the country with a cold front that moved into West Texas and southeast New Mexico during the late afternoon and evening hours. A lot of heat and plentiful low-level moisture were across the area which aided in instability, and there was a surface low in the vicinity of the western Permian Basin. There was an upper level disturbance that moved over the area and intense low level winds that developed that evening and night which brought in more moisture. These conditions, along with good wind shear, allowed for thunderstorms to develop across West Texas and southeast New Mexico. These storms

produced large hail, damaging winds, and flash flooding.

A single engine plane was ripped from its tie down and rolled an estimated 50 yards at the Midland Air Park in Midland, TX from thunderstorm winds. Photo is courtesy of the NWS survey team.

MIDLAND COUNTY --- MIDLAND [32.00, -102.08], 2.5 WSW MIDLAND [31.99, -102.12], 3.4 WNW MIDLAND [32.02, -102.13], 2.3 NNW MIDLAND [32.03, -102.09]

 Source: Law Enforcement

Heavy rain fell across Midland County and produced flash flooding in the City of Midland. There were multiple high water rescues reported in the City of Midland during the early morning hours. The cost of damage is a very rough estimate.

An upper level disturbance moved over the area and contributed to storms developing during the afternoon hours of the previous day with good instability. An intense area of low level winds, known as a low-level jet, developed over the area later in the day/that night and allowed moisture to increase. This low-level jet allowed storms to continue into the overnight and early morning hours. These conditions resulted in storms with flash flooding across the Permian Basin during the early morning hours of the 26th.
