- Table and D-2D Display Features
- Localization
- Customizing SAFESEAS
- The Future of SAFESEAS

What is SAFESEAS?

SAFESEAS is a set of applications in the National Weather Service's Advanced Weather Interactive Processing System (AWIPS). SAFESEAS continuously monitors marine and adjacent overland conditions for specific marine weather hazards. It automatically alerts NWS forecasters whenever such conditions are detected, and provides interactive graphic user interfaces with which the forecaster can easily investigate the data.

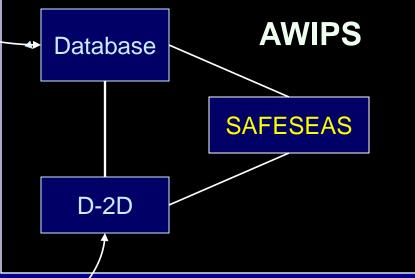

What is SAFESEAS?

Marine warnings and advisories

Observations

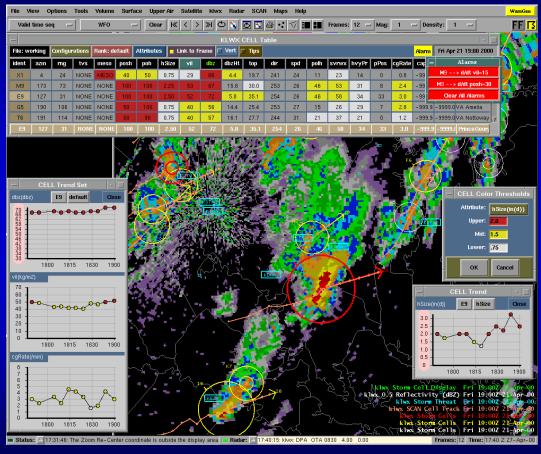

Forecaster

What is SAFESEAS?

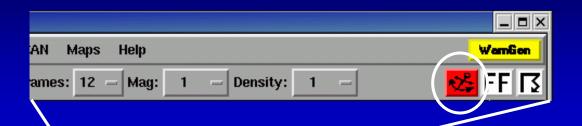

SAFESEAS uses the same approach as SCAN – a persistent background monitor coupled with an interactive D-2D display

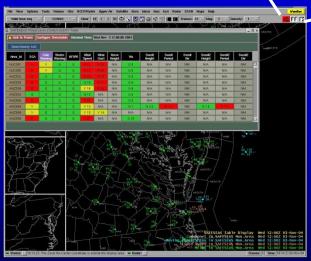

Background Monitoring

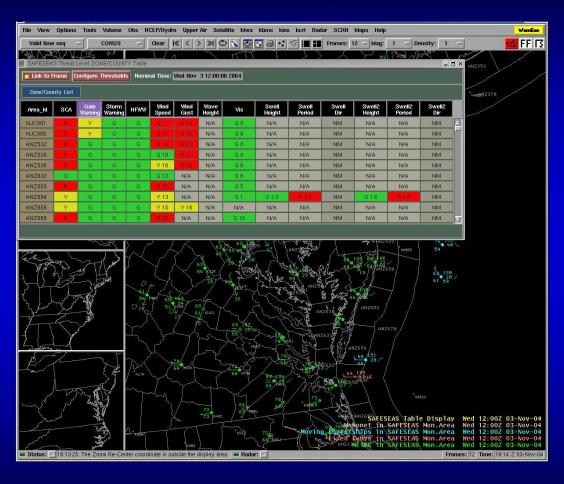

The SAFESEAS Alert button provides configurable, worst-case monitoring, even if SAFESEAS displays are not in use. This is an example of the SCAN monitoring concept.

Table and D-2D Display Features

Interactive Table and D-2D display.

Table and D-2D Display Features

The SAFESEAS Table initially displays the worst-case conditions in each county or zone. Each column can be sorted by value. Selecting a county/zone name will provide information for that area. Letters in the cells aid color-blind forecasters.

Table and D-2D Display Features

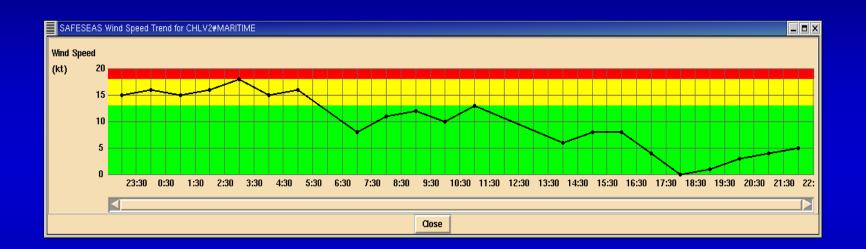

The selected area's observation data points will be displayed. The D-2D map will zoom into the area.

Table and D-2D Display Features

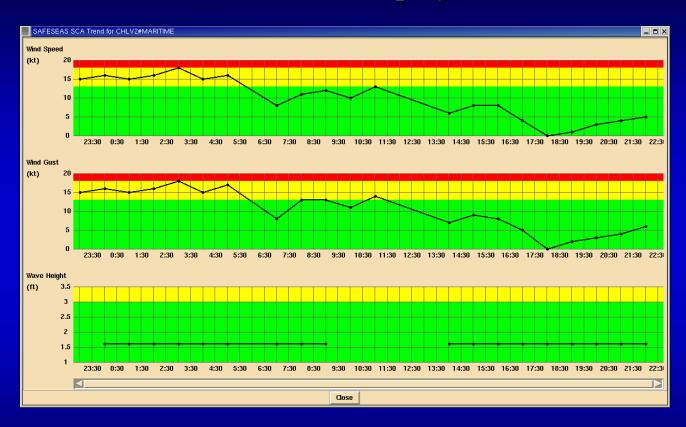

24-Hour trend graphs are available for most parameters. Color levels correspond to those in the table.

Table and D-2D Display Features

Parameters dependent on multiple values can be represented by a series of trend graphs.

Table and D-2D Display Features

Directional parameter trends are represented by hodographs.

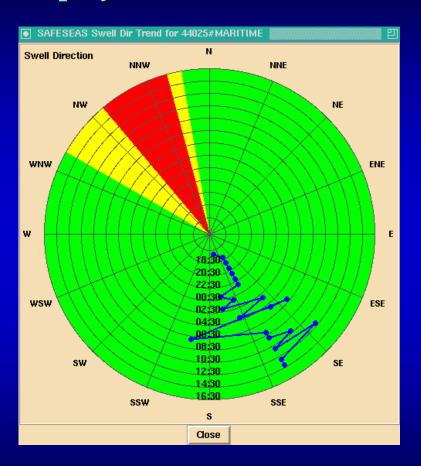

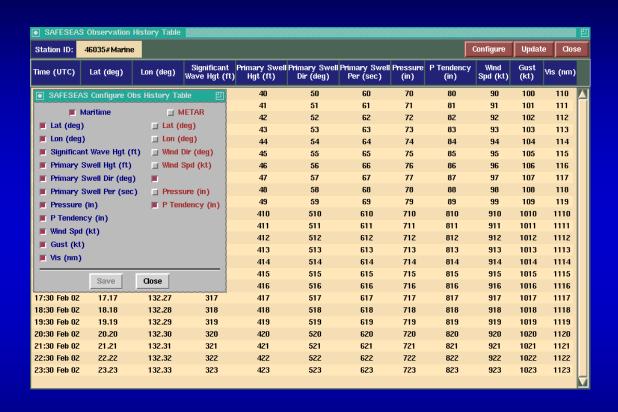

Table and D-2D Display Features

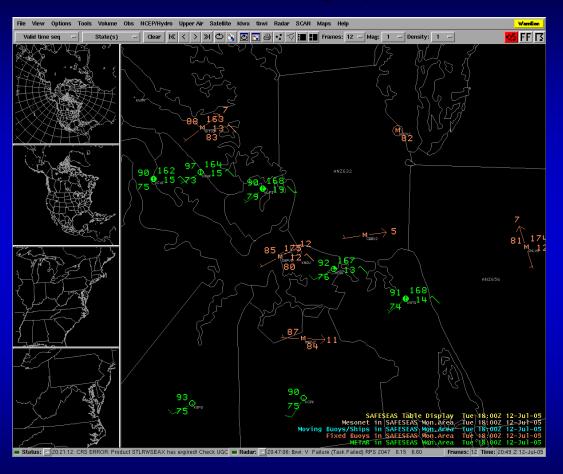

Observation History Table gives trends in tabular form.

Table and D-2D Display Features

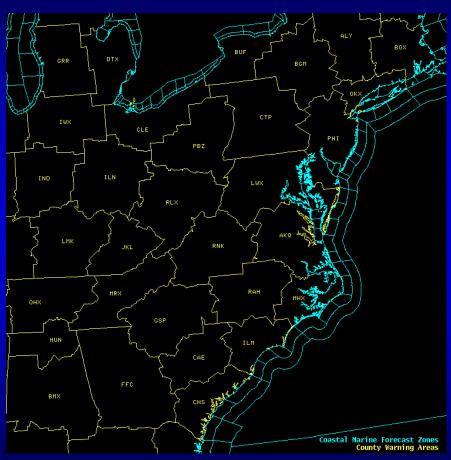

SAFESEAS multiload provides a conventional observation display, differentiated in color by station type.

Localization -- Scope

SAFESEAS localization will be centered around each forecast offices County Warning Area. The localization will set up monitoring for the home county warning area, the neighboring **County Warning Areas** from maritime forecast offices, and the marine zones covered by those forecast offices.

Customizing SAFESEAS -- Display Thresholds

Display Threshold Configuration Tool allows users to customize the levels at which the table parameters change color.

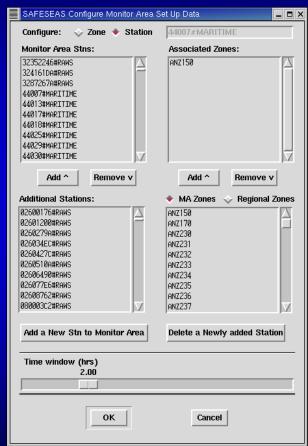

Customizing SAFESEAS – Monitoring Area

SAFESEAS provides a tool for customizing its monitoring area. The forecast office can:

- Add and delete zones and counties.
- Add and delete fixed stations.
- Associate fixed observation stations with zones and counties.

Customizing SAFESEAS -- Thresholds

SAFESEAS provides a tool for customizing the monitor thresholds. Thresholds are zone-specific, and so may be customized for each zone individually.

Fog Monitor

The Fog Monitor uses various algorithms to highlight suspected areas of fog from satellite data. This will be especially helpful in marine zones, where observations are scarce. The first version is being tested for deployment. Point observations will be added in later.

The Future of SAFESEAS - Fog Monitor

The Fog Monitor algorithms will be highly configurable, to allow users to find the best solution for their environment.

Fog Monitor Mandatory Thresholds

• Fog Product [T $(10.7\mu m) - T (3.9\mu m)$]

Nighttime threshold setting allows user to adjust the Fog Product's temperature difference range.

• VIS (Normalized Count)

Daytime range of normalized brightness values.

Maximum Cloud Temperature (C)

Determines the 10.7µm threshold temperature value which the Fog Monitor uses to decide if it is detecting clouds instead of fog.

Fog Monitor Optional Thresholds(1)

• Daytime Ice/Snow vs. Fog Threshold (C)

Takes advantage of strong fog scattering properties at 3.9µm. Helps distinguish bright snowpack from fog.

Cool Fog vs. Warm Surface Threshold (C)

Sets a 10.7 micron brightness temperature (best in thick fog layers, where the measured layer top is colder than the ground).

• Daytime Smoothness Threshold (%)

Finds areas of uniform brightness (helps distinguish fog from midlevel clouds).

Fog Monitor Optional Thresholds(2)

Adjacency Threshold

Filtering the suspected fog areas by size. Sets minimum size standards to discount spurious bright pixels.

Twilight Angle (deg)

Sets the sun angle for "dawn/dusk" area.

Fractal Dimension Threshold

This is a measure of the "jaggedness" of the edges of the detected area. Useful in identifying linear fog bank boundaries compared to jagged cloud edges (but may also filter dendritic valley/river fog.)

Fog Monitor in SAFESEAS

Resizable Table

Instead of having a fixed number of visible zones/counties, the OB7 SAFESEAS table will allow the user to resize it by "dragging".

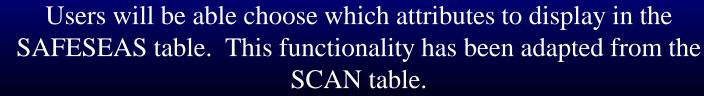

Upcoming Enhancements(3)

Attributes Menu

Upcoming Enhancements(4)

- Additional SAFESEAS enhancements being tested:
 - Inclusion of MAROBS in SAFESEAS
 - Redesigned SAFESEAS configuration GUI
- Additional SAFESEAS/Fog Monitor enhancements approved:
 - > Improved cursor sampling in table
 - > Inclusion of gage depth values.
 - > Inclusion of point observations in Fog Monitor (step toward becoming a general visibility monitor).
 - > Implementation of statistical calculations in Fog Monitor
 - > Observed vs forecast value comparisons??
