

3. Operations Environment

c. Miscellaneous

Raid-5 allows for a single drive to fail at any given time without any data loss. In a multiple disk failure situation data will be lost, thus the importance of still having a backup strategy.

The /awips/hydroapps/.Apps_default files will be provided during the initial installation. Also, during the initial install, an /awips/hydroapps/.Apps_defaults_site file will be created with just the adb_name token in it (correctly set). The /awips/hydroapps/.Apps_defaults file (the national file) will be copied from the ds .Apps_defaults when an AWIPS build is updated. The .Apps_defaults_site file will be left alone.

NFS mount /awips/hydroapps/lx/public/bin off of ds. This will provide access to linux scripts for get_apps_defaults, etc.

Cooked files for the database

Datafeed from SBN will require localization of the acq_patterns.txt file
