Strong thunderstorm wind blew the roof off a c	commercial building , and snappe	ed numerous large	tree limbs. At least	\$35,000 in damage occurred across
-	<b>e</b> 11	-	inderstorm.	-

the afternoon of the 17th, along and ahead of a cold front as a strong upper level disturbance translated into the Southern Plains. Thes storms organized into a surging line of severe thunderstorms as they moved east across northern Oklahoma, reaching eastern Oklahoma during the late evening. Moderately strong instability was in place ahead of the storms, and the wind fields aloft, along with the deep-layer and low-level wind shear, became strong as the upper level disturbance approached from the west. The line of thunderstorms produced widespread wind damage across eastern Oklahoma, with wind gusts in excess of 100 mph at times. Widespread damage to the utility infrastructure occurred, especially throughout counties in northeastern Oklahoma, with nearly a

A ridge of high pressure in the middle and upper atmosphere developed over the south central United States during late June. Unseasonably hot afternoon temperatures reaching the mid 90s to near 100 degrees, combined with high humidity, resulted in heat index values in the 110 to 115 degree range across much of eastern Oklahoma on the 28th and 29th. At least eleven people were treated for heat-related issues in Tulsa, eight of which were transported to the hospital.
