Strong to severe thunderstorms developed over northeastern Oklahoma and southwestern Missouri during the evening of the 9th, along and ahead of a cold front that was moving into the area from the north. A moderately unstable air mass ahead of the front, coupled with strong deep layer wind shear, supported the development of supercell thunderstorms. These storms moved southeast across northeastern Oklahoma, and then evolved into a line of thunderstorms across east central Oklahoma. The strongest storms produced hail up to tennis ball size and damaging wind.

Unseasonably warm temperatures, very low relative humidity, and gusty wind combined with drought-stricken, dormant vegetation to promote the rapid spread of a number of wildfires across eastern Oklahoma during late March 2017. The largest wildfires occurred in Cherokee County where over 5000 acres burned, Adair County where over 2200 acres burned, Pittsburg and Sequoyah Counties where over 1000 acres burned, Delaware County where over 600 acres burned, and Latimer County where over 500 acres burned.

Strong thunderstorm wind damaged several roofs of homes and tore the awning from a home.

Strong to severe thunderstorms developed across central Oklahoma during the late afternoon hours of the 26th, as a dry line moved into the area from the west. These storms moved into eastern Oklahoma during the evening hours, producing hail up to golfball size and damaging wind.

An area of strong thunderstorms moved through eastern Oklahoma during the morning hours of the 29th. Scattered thunderstorms redeveloped across portions of northeastern Oklahoma during the afternoon hours as a cold-core upper level storm system moved northeast across the area. The strongest storms produced hail up to quarter size.
